Confinement Mechanism(s?)

Hadrons are singlets under $SU(3)_{\text{color}}$: No net color charge in asymptotic particle states

- **Linear growth of the static quark-antiquark pair**
Area-law falloff for the Wilson loop
- **Gribov Confinement for light quarks**
Analytical properties of the propagators in the infrared
Instability of the vacuum above a supercritical charge

$$\alpha_{\text{QED}}^{\text{crit}} = 137 \text{ for a point-like nucleus}$$

$$\approx 180 \text{ for a finite size nucleus}$$

$$\frac{\alpha_{\text{QCD}}^{\text{crit}}}{\pi} = C_F^{-1} \left[1 - \sqrt{\frac{2}{3}} \right] \approx 0.137$$

- **Light-Front AdS/QCD**
quark and gluon chiral condensates confined!
→ condensates contribution to the cosmological constant already included in hadron mass
- Mass-Gap Millennium problem and Yang-Mills existence
\$1M from the Clay Mathematical Institute

Gravity and QCD

In some fundamental sense a *graviton* can be thought of as a *pair of vector bosons*: Gravity amplitudes appear as squared Yang-Mills amplitudes in the *Color-Kinematics Duality*

Understanding the deeper origin of these dualities is at the heart of string theory. Here a graviton (closed string) happens naturally as a pair of vector bosons (open strings). The **duality** between Gravity in the bulk and QCD on the boundary of AdS space, also called **holographic principle** is the currently the all time most cited high energy physics publication

Gravitational Form Factors from QCD bound states are observables of choice to test these dualities. Most promising avenue to understand the non-perturbative structure of gauge theories.

Energy Momentum Tensor

Gravitational Form Factors definition :

$$\langle p' | \hat{T}_{\mu\nu}^q | p \rangle = \bar{N}(p') \left[M_2^q(t) \frac{P_\mu P_\nu}{M} + J^q(t) \frac{i(P_\mu \sigma_{\nu\rho} + P_\nu \sigma_{\mu\rho}) \Delta^\rho}{2M} + d_1^q(t) \frac{\Delta_\mu \Delta_\nu - g_{\mu\nu} \Delta^2}{5M} \right] N(p)$$

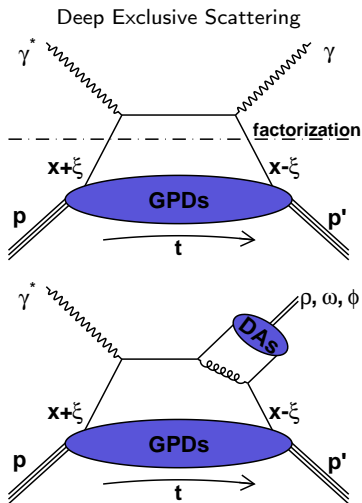

Confinement forces from space-space components of EMT
 The graviton with spin 2 couples directly to EMT
 But gravity is too weak to produce count rates in the detector

We can construct a spin 2 operator using two spin 1 operators
 → use a process with two photons to measure the EMT?

Generalized Parton Distributions

$$\gamma^* p \rightarrow \gamma p', \rho p', \omega p', \phi p'$$

Bjorken regime :

$$Q^2 \rightarrow \infty, x_B \text{ fixed}$$

$$t \text{ fixed} \ll Q^2, \xi \rightarrow \frac{x_B}{2-x_B}$$

$$\frac{P^+}{2\pi} \int dy^- e^{ixP^+y^-} \langle p' | \bar{\psi}_q(0) \gamma^+ (1+\gamma^5) \psi(y) | p \rangle$$

$$= \bar{N}(p') \left[H^q(x, \xi, t) \gamma^+ + E^q(x, \xi, t) i\sigma^{+\nu} \frac{\Delta_\nu}{2M} + \check{H}^q(x, \xi, t) \gamma^+ \gamma^5 + \check{E}^q(x, \xi, t) \gamma^5 \frac{\Delta^+}{2M} \right] N(p)$$

spin	N no flip	N flip
q no flip	H	E
q flip	\check{H}	\check{E}

3-D Imaging conjointly in transverse impact parameter **and** longitudinal momentum

Generalized Parton Distributions

$$\begin{aligned} & \frac{P^+}{2\pi} \int dy^- e^{ixP^+y^-} \langle p' | \bar{\psi}_q(0) \gamma^+ (1 + \gamma^5) \psi(y) | p \rangle \\ &= \bar{N}(p') \left[H^q(x, \xi, t) \gamma^+ + E^q(x, \xi, t) i\sigma^{+\nu} \frac{\Delta_\nu}{2M} \right. \\ & \quad \left. + \tilde{H}^q(x, \xi, t) \gamma^+ \gamma^5 + \tilde{E}^q(x, \xi, t) \gamma^5 \frac{\Delta^+}{2M} \right] N(p) \end{aligned}$$

Parton longitudinal momentum fraction distributions

$$\frac{1}{4\pi} \int dy^- e^{ixP^+y^-} \langle p | \bar{\psi}_q(0) \gamma^+ \psi(y) | p \rangle = f_q(x)$$

$$H^q(x, \xi = 0, t = 0) = f_q(x)$$

Form Factors - Fourier transform of transverse spatial distributions

$$\langle p' | \bar{\psi}_q(0) \gamma^+ \psi(0) | p \rangle = \bar{N}(p') \left[F_1^q(t) \gamma^+ + F_2^q(t) i\sigma^{+\nu} \frac{\Delta_\nu}{2M} \right] N(p)$$

$$\int_{-1}^1 dx H^q(x, \xi, t) = F_1^q(t) \quad \text{First x-moment}$$

$$\int_{-1}^1 dx E^q(x, \xi, t) = F_2^q(t)$$

Gravitational Form Factors and GPDs

Form Factors accessed *via* second x-moments :

$$\langle p' | \hat{T}_{\mu\nu}^q | p \rangle = \bar{N}(p') \left[M_2^q(t) \frac{P_\mu P_\nu}{M} + J^q(t) \frac{i(P_\mu \sigma_{\nu\rho} + P_\nu \sigma_{\mu\rho}) \Delta^\rho}{2M} + d_1^q(t) \frac{\Delta_\mu \Delta_\nu - g_{\mu\nu} \Delta^2}{5M} \right] N(p)$$

Angular momentum distribution

$$J^q(t) = \frac{1}{2} \int_{-1}^1 dx x [H^q(x, \xi, t) + E^q(x, \xi, t)]$$

Mass and force/pressure distributions

$$M_2^q(t) + \frac{4}{5} d_1^q(t) \xi^2 = \frac{1}{2} \int_{-1}^1 dx x H^q(x, \xi, t)$$

$$d_1(t) = 15M \int d^3\vec{r} \frac{j_0(r\sqrt{-t})}{2t} p(r)$$

Distribution of pressure
 $r^2 p(r)$ in GeV fm^{-1}

Deeply Virtual Compton Scattering

The cleanest GPD probe at low and medium energies

$$\sigma(ep \rightarrow ep\gamma) \propto \left| \begin{array}{c} \text{DVCS} \\ \text{BH} \end{array} \right|^2$$

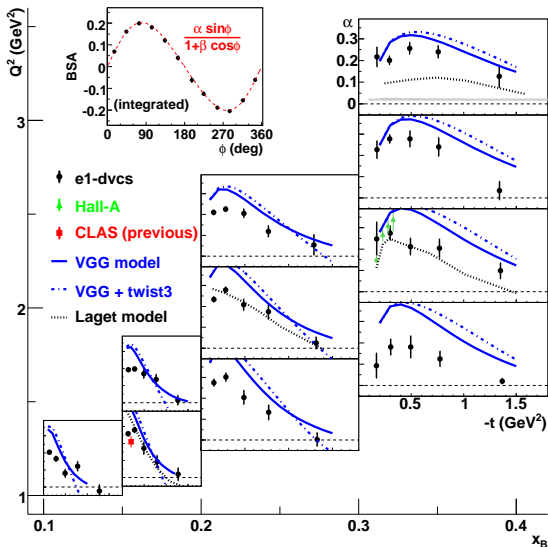

$$A_{LU} = \frac{d^4\sigma^{\rightarrow} - d^4\sigma^{\leftarrow}}{d^4\sigma^{\rightarrow} + d^4\sigma^{\leftarrow}} \stackrel{\text{twist-2}}{\approx} \frac{\alpha \sin \phi}{1 + \beta \cos \phi}$$

$$\alpha \propto \text{Im} \left(F_1 \mathcal{H} + \xi G_M \tilde{\mathcal{H}} - \frac{t}{4M^2} F_2 \mathcal{E} \right)$$

$$\mathcal{H}(\xi, t) = i\pi H(\xi, \xi, t) + \mathcal{P} \int_{-1}^1 dx \frac{H(x, \xi, t)}{x - \xi}$$

DVCS Beam Spin Asymmetry

$$F_1 \mathcal{H} + \xi G_M \tilde{\mathcal{H}} - \frac{t}{4M^2} F_2 \mathcal{E}$$

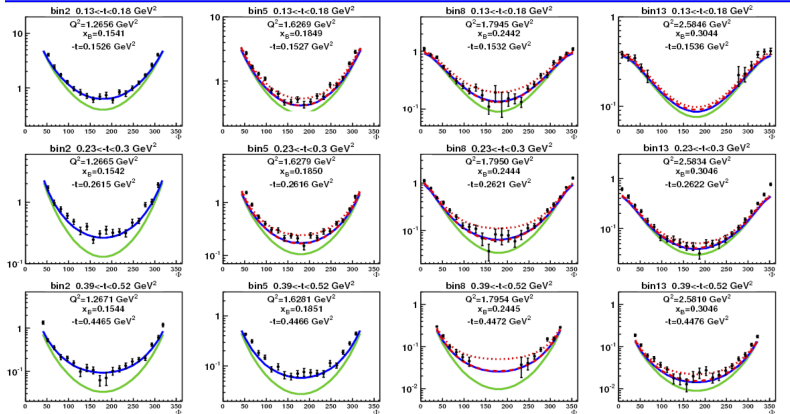

Precision in a large phase-space (x_B , Q^2 , t)

Qualitative model agreement

quantitative constraints on parameters

F.-X. G. et al., PRL 100 162002 (2008)

DVCS Unpolarized Cross-Sections

$$\bullet \frac{d^4\sigma_{ep \rightarrow ep\gamma}}{dQ^2 dx_B dt d\Phi} \text{ (nb/GeV}^4\text{)}$$

— BH — VGG (H only)
⋯ KM10 --- KM10a

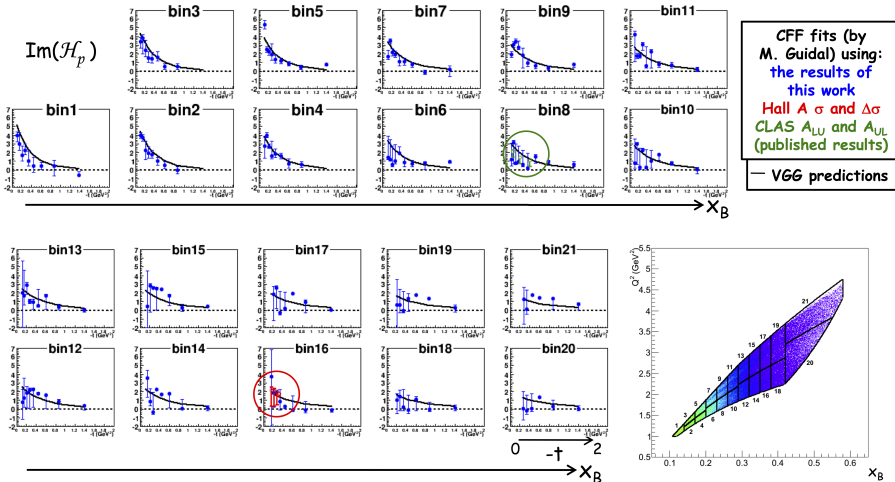

VGG : Vanderhaeghen, Guichon, Guidal

KM : Kumericki, Mueller

H.-S. Jo et al., PRL 115 212003 (2015)

Compton Form Factors

The t -slope becomes flatter with increasing x_B :
 valence quarks (higher x_B) at the center of the nucleon and sea quarks (small x_B) at its periphery

Beam Spin Asymmetries

$$\text{Im}\mathcal{H}(\xi, t) = \frac{r}{1+x} \left(\frac{2\xi}{1+\xi} \right)^{-\alpha(t)} \left(\frac{1-\xi}{1+\xi} \right)^b \left(\frac{1-\xi}{1+\xi} \frac{t}{M^2} \right)^{-1}$$

Unpolarized cross-sections

Use dispersion relation:

$$\text{Re}\mathcal{H}(\xi, t) = D + \mathcal{P} \int dx \left(\frac{1}{\xi - x} - \frac{1}{\xi + x} \right) \text{Im}\mathcal{H}(\xi, t)$$

pure Bethe-Heitler

local fit + uncertainty range

resulting global fit

$$D^q\left(\frac{x}{\xi}, t\right) = \left(1 - \frac{x^2}{\xi^2}\right) \left[d_1^q(t) C_1^{3/2}\left(\frac{x}{\xi}\right) + d_3^q(t) C_3^{3/2}\left(\frac{x}{\xi}\right) + \dots \right]$$

t-dependence of the D-term :

Dipole gives singular pressure at $r = 0$

Quadrupole implied by counting rules?

Exponential?

...

$d_1(0) < 0$ dynamical **stability** of bound state

$$d_1(0) = -2.04 \pm 0.14 \pm 0.33$$

First Measurement of new fundamental quantity

D-term comparison with theory

Summary and Outlook

- A new perspective on Exclusive Reactions Physics
- **First Ever Measurement of Gravitational Form Factors**
- Opens a new avenue to test confinement mechanism
- Partonic Energy Momentum Tensor
- Exciting times at the beginning of the 12 GeV high precision era!
- Will be an essential part of the EIC program as well

CLAS12 GPD program
