Microscopic Many-Body Theory

Hamiltonian, wave functions, observables

Postulate:

1 Hamiltonian $H = -\sum_i \frac{\hbar^2}{2m} \nabla_i^2 + \sum_i V_{\text{ext}}(i) + \sum_{i<j} V(i,j)$

Microscopic Many-Body Theory

Hamiltonian, wave functions, observables

Postulate:

- 1 Hamiltonian $H = -\sum_i \frac{\hbar^2}{2m} \nabla_i^2 + \sum_i V_{\text{ext}}(i) + \sum_{i<j} V(i,j)$
- 2 Particle number, mass, interactions, statistics

Microscopic Many-Body Theory

Hamiltonian, wave functions, observables

Postulate:

- 1 Hamiltonian $H = -\sum_i \frac{\hbar^2}{2m} \nabla_i^2 + \sum_i V_{\text{ext}}(i) + \sum_{i<j} V(i,j)$
- 2 Particle number, mass, interactions, statistics

Unpack your tools:

$$H(t)|\psi(t)\rangle = i\hbar \frac{\partial}{\partial t} |\psi(t)\rangle +$$

The equation of state

The easy questions ...

A truly microscopic many-body theory should:

- Be robust against the choice of interactions;

The equation of state

The easy questions ...

A truly microscopic many-body theory should:

- Be robust against the choice of interactions;
- Have no answers if “mother nature” does not have them;

The equation of state

The easy questions ...

A truly microscopic many-body theory should:

- Be robust against the choice of interactions;
- Have no answers if “mother nature” does not have them;
- **Not:** accept arguments “approximation A *works better* than approximation B”;

r (some units)

ρ (some units)

The equation of state

A closer look

- Low densities: Pauli pressure dominates \rightarrow repulsive Fermi gas

The equation of state

A closer look

- No homogeneous solution \rightarrow clustering
- Many-body binding
- Saturation
- Other phase transitions ?

What physics tells us:

The argument for parquet diagrams

- Binding and saturation \implies short-ranged structure:
 - “bending” of the wave function at small interparticle distances;
 - “local screening” or “local field corrections” in electron systems.

What physics tells us:

The argument for parquet diagrams

- Binding and saturation \implies short-ranged structure:
 - “bending” of the wave function at small interparticle distances;
 - “local screening” or “local field corrections” in electron systems.
- “No answers when mother nature does not have them”:
 - Show correct instabilities;
 - Deal properly with long-ranged correlations;

What physics tells us:

The argument for parquet diagrams

- Binding and saturation \implies short-ranged structure:
 - “bending” of the wave function at small interparticle distances;
 - “local screening” or “local field corrections” in electron systems.
- “No answers when mother nature does not have them”:
 - Show correct instabilities;
 - Deal properly with long-ranged correlations;

Translate this into the language of perturbation theory:

Short-ranged structure	\implies	Ladder diagrams
Long-ranged structure	\implies	Ring diagrams
Consistency	\implies	parquet diagrams

Correlated wave functions (“Jastrow-Feenberg”):

“Quick and dirty” or “intuitive” ?

What looked like a “simple quick and dirty” method:

$$\Psi_0(1, \dots, N) = \exp \frac{1}{2} \left[\sum_i u_1(\mathbf{r}_i) + \sum_{i < j} u_2(\mathbf{r}_i, \mathbf{r}_j) + \dots \right] \Phi_0(1, \dots, N)$$

$$\equiv F(1, \dots, N) \Phi_0(1, \dots, N)$$

$\Phi_0(1, \dots, N)$

“Model wave function” (Slater determinant)

- An intuitive way to include

- Express everything in terms of **physical observables**.

Parquet diagrams: Summing rings, ladders, and self-energy contributions

72

A.D. Jackson et al., *Variational and perturbation theories made planar*

Fig. 5. The parquet contributions to the two-particle vertex, Γ , through sixth order in V . Here, horizontal lines denote the potential. The remaining lines denote propagating particles. Note that self-energy insertions are not indicated.

Local parquet diagrams: making parquet practical

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

(100 pages Physics Reports in a nutshell)

- Begin with a local particle-hole interaction, sum the ring diagrams

$$\chi(\mathbf{q}, \omega) = \chi_0(\mathbf{q}, \omega) / (1 - \tilde{V}_{\text{p-h}}(\mathbf{q})\chi_0(\mathbf{q}, \omega))$$

Local parquet diagrams: making parquet practical

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

(100 pages Physics Reports in a nutshell)

- Begin with a local particle-hole interaction, sum the ring diagrams

$$\chi(\mathbf{q}, \omega) = \chi_0(\mathbf{q}, \omega) / (1 - \tilde{V}_{\text{p-h}}(\mathbf{q})\chi_0(\mathbf{q}, \omega))$$

- Define an **energy-dependent** particle-hole reducible interaction

$$\tilde{w}_1(\mathbf{q}, \omega) = \tilde{V}_{\text{p-h}}(\mathbf{q}) / (1 - \tilde{V}_{\text{p-h}}(\mathbf{q})\chi_0(\mathbf{q}, \omega))$$

$$\chi(\mathbf{q}, \omega) = \chi_0(\mathbf{q}, \omega) + \chi_0(\mathbf{q}, \omega)\tilde{w}_1(\mathbf{q}, \omega)\chi_0(\mathbf{q}, \omega)$$

Local parquet diagrams: making parquet practical

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

(100 pages Physics Reports in a nutshell)

- Begin with a local particle-hole interaction, sum the ring diagrams

$$\chi(\mathbf{q}, \omega) = \chi_0(\mathbf{q}, \omega) / (1 - \tilde{V}_{\text{p-h}}(\mathbf{q})\chi_0(\mathbf{q}, \omega))$$

- Define an **energy-dependent** particle-hole reducible interaction

$$\begin{aligned}\tilde{w}_1(\mathbf{q}, \omega) &= \tilde{V}_{\text{p-h}}(\mathbf{q}) / (1 - \tilde{V}_{\text{p-h}}(\mathbf{q})\chi_0(\mathbf{q}, \omega)) \\ \chi(\mathbf{q}, \omega) &= \chi_0(\mathbf{q}, \omega) + \chi_0(\mathbf{q}, \omega)\tilde{w}_1(\mathbf{q}, \omega)\chi_0(\mathbf{q}, \omega)\end{aligned}$$

- Define an **energy-independent** particle-hole reducible interaction by demanding that it gives the same observable $S(\mathbf{q})$:

$$\begin{aligned}& \int_0^\infty d\omega \Im m [\chi_0(\mathbf{q}, \omega)\tilde{w}_1(\mathbf{q}, \omega)\chi_0(\mathbf{q}, \omega)] \\ &= \int_0^\infty d\omega \Im m [\chi_0(\mathbf{q}, \omega)\tilde{w}_1(\mathbf{q}, \bar{\omega}(\mathbf{q}))\chi_0(\mathbf{q}, \omega)]\end{aligned}$$

Parquet diagrams: Ladder diagram summation

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

- Sum the ladder diagrams with this local interaction

$$\frac{\hbar^2}{m} \nabla^2 \psi(r) = (v(r) + w_I(r)) \psi(r)$$

Parquet diagrams: Ladder diagram summation

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

- Sum the ladder diagrams with this local interaction

$$\frac{\hbar^2}{m} \nabla^2 \psi(r) = (v(r) + w_I(r)) \psi(r)$$

- Note that

$$g(r) = |\psi(r)|^2 = 1 + \int \frac{d^3 k}{(2\pi)^3 \rho} [S(k) - 1] e^{i r \cdot k}$$

Parquet diagrams: Ladder diagram summation

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

- Sum the ladder diagrams with this local interaction

$$\frac{\hbar^2}{m} \nabla^2 \psi(r) = (v(r) + w_I(r)) \psi(r)$$

- Note that

$$g(r) = |\psi(r)|^2 = 1 + \int \frac{d^3k}{(2\pi)^3 \rho} [S(k) - 1] e^{i\mathbf{r} \cdot \mathbf{k}}$$

- Construct a local particle-hole irreducible interaction

Parquet diagrams: Ladder diagram summation

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

- Sum the ladder diagrams with this local interaction

$$\frac{\hbar^2}{m} \nabla^2 \psi(r) = (v(r) + w_I(r)) \psi(r)$$

- Note that

$$g(r) = |\psi(r)|^2 = 1 + \int \frac{d^3k}{(2\pi)^3 \rho} [S(k) - 1] e^{i\mathbf{r} \cdot \mathbf{k}}$$

- Construct a local particle–hole irreducible interaction
- Repeat the process to convergence

Parquet diagrams: Ladder diagram summation

Jackson, Lande, Smith: Physics Reports **86**, 55 (1982)

- Sum the ladder diagrams with this local interaction

$$\frac{\hbar^2}{m} \nabla^2 \psi(r) = (v(r) + w_I(r)) \psi(r)$$

- Note that

$$g(r) = |\psi(r)|^2 = 1 + \int \frac{d^3k}{(2\pi)^3 \rho} [S(k) - 1] e^{ir \cdot k}$$

- Construct a local particle–hole irreducible interaction
- Repeat the process to convergence

At the end of all of this:

The local parquet-diagram summation leads, for bosons, to equations that are identical to the Euler equations of Jastrow–Feenberg theory.

Two-body Euler or local parquet equations for bosons

Summarizing its two faces

“RPA” face

$$\begin{aligned}\chi^{(RPA)}(\mathbf{q}, \omega) &= \frac{\chi_0(\mathbf{q}, \omega)}{1 - \tilde{V}_{\text{p-h}}(\mathbf{q})\chi_0(\mathbf{q}, \omega)} \\ S(\mathbf{q}) &= -\frac{\hbar}{\pi} \int d\omega \Im m \chi(\mathbf{q}, \omega) \\ &= \left[1 + 4m\tilde{V}_{\text{p-h}}(\mathbf{q})/\hbar^2 q^2 \right]^{-\frac{1}{2}}\end{aligned}$$

Two-body Euler or local parquet equations for bosons

Summarizing its two faces

“RPA” face

$$\begin{aligned}\chi^{(RPA)}(\mathbf{q}, \omega) &= \frac{\chi_0(\mathbf{q}, \omega)}{1 - \tilde{V}_{p-h}(\mathbf{q})\chi_0(\mathbf{q}, \omega)} \\ S(\mathbf{q}) &= -\frac{\hbar}{\pi} \int d\omega \Im m \chi(\mathbf{q}, \omega) \\ &= \left[1 + 4m\tilde{V}_{p-h}(\mathbf{q})/\hbar^2 q^2 \right]^{-\frac{1}{2}}\end{aligned}$$

“Bethe-Goldstone” face

$$\frac{\hbar^2}{m} \nabla^2 \sqrt{g(r)} = V_{p-p}(r) \sqrt{g(r)}$$

Two-body Euler or local parquet equations for bosons

Summarizing its two faces

“RPA” face

$$\begin{aligned}\chi^{(RPA)}(\mathbf{q}, \omega) &= \frac{\chi_0(\mathbf{q}, \omega)}{1 - \tilde{V}_{p-h}(\mathbf{q})\chi_0(\mathbf{q}, \omega)} \\ S(\mathbf{q}) &= -\frac{\hbar}{\pi} \int d\omega \Im m \chi(\mathbf{q}, \omega) \\ &= \left[1 + 4m\tilde{V}_{p-h}(\mathbf{q})/\hbar^2 q^2 \right]^{-\frac{1}{2}}\end{aligned}$$

“Bethe-Goldstone” face

$$\frac{\hbar^2}{m} \nabla^2 \sqrt{g(r)} = V_{p-p}(r) \sqrt{g(r)}$$

“Parquet” face

Consistency between $S(\mathbf{q})$ and $g(r)$

Parquet diagrams: Self-energy corrections

What is missing beyond rings and ladders ?

Parquet diagrams: Self-energy corrections

Findings:

- Combining all that is missing at that order is equivalent to including three-body correlations

$$\frac{E_3}{N} = -\frac{1}{24} \int \frac{d^3k d^3p d^3q}{(2\pi)^6 \rho^2} \frac{S(p)S(k)S(q) |V_3(\mathbf{p}, \mathbf{k}, \mathbf{q})|^2}{\varepsilon(k) + \varepsilon(p) + \varepsilon(q)}$$

(PRB **55**, 12925 (1997)).

Parquet diagrams: Self-energy corrections

Findings:

- Combining all that is missing at that order is equivalent to including three-body correlations

$$\frac{E_3}{N} = -\frac{1}{24} \int \frac{d^3k d^3p d^3q}{(2\pi)^6 \rho^2} \frac{S(p)S(k)S(q) |V_3(\mathbf{p}, \mathbf{k}, \mathbf{q})|^2}{\varepsilon(k) + \varepsilon(p) + \varepsilon(q)}$$

(PRB **55**, 12925 (1997)).

- Effect is about 10 percent of the binding energy in ^3He and ^4He , negligible in electrons

Parquet diagrams: Self-energy corrections

Findings:

- Combining all that is missing at that order is equivalent to including three-body correlations

$$\frac{E_3}{N} = -\frac{1}{24} \int \frac{d^3k d^3p d^3q}{(2\pi)^6 \rho^2} \frac{S(p)S(k)S(q) |V_3(\mathbf{p}, \mathbf{k}, \mathbf{q})|^2}{\varepsilon(k) + \varepsilon(p) + \varepsilon(q)}$$

(PRB **55**, 12925 (1997)).

- Effect is about 10 percent of the binding energy in ^3He and ^4He , negligible in electrons
- The individual terms are large, their sum is small** (Jackson, Lande, Guitink, Smith: PRB **31**, 403-415 (1985)).

Parquet diagrams: Self-energy corrections

Findings:

- Combining all that is missing at that order is equivalent to including three-body correlations

$$\frac{E_3}{N} = -\frac{1}{24} \int \frac{d^3k d^3p d^3q}{(2\pi)^6 \rho^2} \frac{S(p)S(k)S(q) |V_3(\mathbf{p}, \mathbf{k}, \mathbf{q})|^2}{\varepsilon(k) + \varepsilon(p) + \varepsilon(q)}$$

(PRB **55**, 12925 (1997)).

- Effect is about 10 percent of the binding energy in ^3He and ^4He , negligible in electrons
- The individual terms are large, their sum is small** (Jackson, Lande, Guitink, Smith: PRB **31**, 403-415 (1985)).

Coester's Commandment:

Thou shalt not split small quantities into large pieces !

Local parquet diagram for fermions

(1) Ring diagrams

- RPA

$$S(q) = - \int_0^\infty \frac{d\omega}{\pi} \Im m \chi^{(RPA)}(q, \omega) = - \int_0^\infty \frac{d\omega}{\pi} \frac{\chi_0(q, \omega)}{1 - \tilde{V}_{p-h}(q) \chi_0(q, \omega)}$$

Local parquet diagram for fermions

$$\widetilde{W}(q, \omega) = \frac{\widetilde{V}_{p-h}(q)}{1 - \widetilde{V}_{p-h}(q)\chi_0(q, \omega)}$$

Particle-hole reducible part

$$\widetilde{w}_I(q, \omega) = \widetilde{W}(q, \omega) - \widetilde{V}_{p-h}(q) = \frac{\widetilde{V}_{p-h}(q)\chi_0(q, \omega)}{1 - \widetilde{V}_{p-h}(q)\chi_0(q, \omega)}.$$

- Localization procedure

$$\begin{aligned} S(q) &= - \int_0^\infty \frac{d\omega}{\pi} \Im m \left[\chi_0(q, \omega) + \chi_0(q, \omega) \widetilde{W}(q, \bar{\omega}(q)) \chi_0(q, \omega) \right] \\ &= S_F(q) - \widetilde{W}(q, \bar{\omega}(q)) \int_0^\infty \frac{d\omega}{\pi} \Im m \chi_0^2(q, \omega). \end{aligned}$$

- Carry this out for the full or the collective Lindhard function

Summarizing:

..connection of Jastrow-FHNC

“Localization” of the energy demoninator

$$e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}} \rightarrow \bar{e}(q) = \frac{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q}) n(\mathbf{h}) (e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}})}{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q}) n(\mathbf{h})}$$

Summarizing:

..connection of Jastrow-FHNC

“Localization” of the energy demoninator

$$e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}} \rightarrow \bar{e}(q) = \frac{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q}) n(\mathbf{h}) (e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}})}{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q}) n(\mathbf{h})}$$

- FHNC-EL or local parquet equations

Summarizing:

..connection of Jastrow-FHNC

“Localization” of the energy demoninator

$$e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}} \rightarrow \bar{e}(q) = \frac{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q})n(\mathbf{h})(e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}})}{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q})n(\mathbf{h})}$$

- FHNC-EL or local parquet equations
- Of course, many more fermion diagrams due to exchange structure

“Localization” of the energy demoninator

$$e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}} \rightarrow \bar{e}(\mathbf{q}) = \frac{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q})n(\mathbf{h})(e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}})}{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q})n(\mathbf{h})}$$

- FHNC-EL or local parquet equations
- Of course, many more fermion diagrams due to exchange structure
- The variational feature makes sure that the approximations are the best one can do for the price.

Summarizing:

..connection of Jastrow-FHNC

“Localization” of the energy demoninator

$$e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}} \rightarrow \bar{e}(q) = \frac{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q})n(\mathbf{h})(e_{\mathbf{q}+\mathbf{h}} - e_{\mathbf{h}})}{\sum_{\mathbf{h}} \bar{n}(\mathbf{h} + \mathbf{q})n(\mathbf{h})}$$

- FHNC-EL or local parquet equations
- Of course, many more fermion diagrams due to exchange structure
- The variational feature makes sure that the approximations are the best one can do for the price.

The CBF strategy to do better:

- Sum all parquet diagrams (and, if you care, add fully irreducible) in local approximation
- Correct specific sets of diagrams if needed.

Two-body Euler or local parquet equations for fermions

Summarizing its two faces

(Collective) “RPA” face

- If you care to: Add self-energy diagrams

They are called “cyclic chain” diagrams in the language of variational theory

- If so, please include exchange diagrams

They are included in variational theory

- and mind Coester's commandment !

Verification I: Lennard-Jones and square-well fluids

How well it works (Bragbook)

- A family of Lennard-Jones and square-well interactions

$$V_{\text{LJ}}(r) = 4V_0 \left[\left(\frac{\sigma}{r}\right)^{12} - \left(\frac{\sigma}{r}\right)^6 \right]$$

$$\equiv \frac{\hbar^2}{2m\sigma^2} 4\varepsilon \left[\left(\frac{\sigma}{r}\right)^{12} - \left(\frac{\sigma}{r}\right)^6 \right]$$

$$V_{\text{SC}}(r) = -\varepsilon\Theta(\sigma - r)$$

Verification I: Lennard-Jones and square-well fluids

How well it works (Bragbook)

- A family of Lennard-Jones and square-well interactions

$$V_{\text{LJ}}(r) = 4V_0 \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^6 \right]$$
$$\equiv \frac{\hbar^2}{2m\sigma^2} 4\varepsilon \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^6 \right]$$

$$V_{\text{SC}}(r) = -\varepsilon \Theta(\sigma - r)$$

- Adjust ε to obtain the desired scattering length a_0 (the cold gas people want it that way);

Verification I: Lennard-Jones and square-well fluids

How well it works (Bragbook)

- A family of Lennard-Jones and square-well interactions

$$V_{\text{LJ}}(r) = 4V_0 \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^6 \right]$$
$$\equiv \frac{\hbar^2}{2m\sigma^2} 4\varepsilon \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^6 \right]$$

$$V_{\text{SC}}(r) = -\varepsilon \Theta(\sigma - r)$$

- Adjust ε to obtain the desired scattering length a_0 (the cold gas people want it that way);
- First bound state appears at $\varepsilon = 11.18$ (4.33) \Rightarrow Divergence of the vacuum scattering length.

Verification I: The Lennard-Jones liquid

How well it works (Bragbook)

- Equation of state for Bosons

Verification I: The Lennard-Jones liquid

How well it works (Bragbook)

- Equation of state for Bosons
- Equation of state for Fermions

Verification I: The Lennard-Jones liquid

How well it works (Bragbook)

- Equation of state for Bosons
- Equation of state for Fermions
- “Quick and dirty” version has percent accuracy below 0.25* (saturation density). **No new physics is learned from doing a better calculation.**

Verification I: The Lennard-Jones liquid

How well it works (Bragbook)

- Equation of state for Bosons
- Equation of state for Fermions
- “Quick and dirty” version has percent accuracy below 0.25* (saturation density). **No new physics is learned from doing a better calculation.**
- Works the same in 2D

Verification I: The Lennard-Jones liquid

How well it works (Bragbook)

- Equation of state for Bosons
- Equation of state for Fermions
- “Quick and dirty” version has percent accuracy below 0.25* (saturation density). **No new physics is learned from doing a better calculation.**
- Works the same in 2D
- FHNC-EL (or parquet) has no solutions if “mother nature” cannot make the system: The equation of state ends at the spinodal points.

Verification II: Nuclear interactions

Argonne and Reid V_4

- Equation of state for Neutron matter interacting via Argonne and Reid V_4 potentials

Verification II: Nuclear interactions

Argonne and Reid V_4

- Equation of state for Neutron matter interacting via Argonne and Reid V_4 potentials
- “Quick and dirty” version has percent accuracy below $0.2 \cdot (\text{nuclear matter density})..$

Verification II: Nuclear interactions

Argonne and Reid V_4

- Equation of state for Neutron matter interacting via Argonne and Reid V_4 potentials
- “Quick and dirty” version has percent accuracy below 0.2^* (nuclear matter density)..
- This contains only central correlations. “Twisted chain” diagrams (beyond parquet) may be very important !

Low-density calculations

– the many-body effects

- Three (not two) range regimes

Low-density calculations

BCS Theory with strong correlations

How to derive a BCS wave function with correlations

$$|\text{BCS}\rangle = \prod_{\mathbf{k}} \left[u_{\mathbf{k}} + v_{\mathbf{k}} a_{\mathbf{k}\uparrow}^{\dagger} a_{-\mathbf{k}\downarrow}^{\dagger} \right] |0\rangle$$

$$|\text{CBCS}\rangle = \sum_{N,\mathbf{m}} \frac{1}{\sqrt{I_{mm}}} F_N |\mathbf{m}^{(N)}\rangle \langle \mathbf{m}^{(N)} | \text{BCS} \rangle$$

- EK and J. W. Clark, Nucl. Phys. A333, 77 (1980)
- EK, R. A. Smith and A. D. Jackson: Phys Rev. **B24**, 6404 (1981)
- H.-H. Fan, EK, T. Lichtenegger, D. Mateo and R. Zillich, Phys Rev. **A92**, 023640, (2015)

Strategy: Expand in terms of the *deviation* of the Bogoliubov amplitudes from their normal system values !

At QFS 2018, Tokyo:, A. J. Leggett

We should not build the superfluid system by creating Cooper pairs from the vacuum, but rather generate Cooper pairs from normal interacting system one at a time.

BCS Theory with strong correlations

Analysis of the pairing interaction:

After lengthy calculations: An (almost) ordinary gap equation

$$\Delta_{\mathbf{k}} = -\frac{1}{2} \sum_{\mathbf{k}'} \mathcal{P}_{\mathbf{k}\mathbf{k}'} \frac{\Delta_{\mathbf{k}'}}{\sqrt{(\mathbf{e}_{\mathbf{k}'} - \mu)^2 + \Delta_{\mathbf{k}'}}^2}.$$

At low densities, all operators become local

$$\begin{aligned} \mathcal{P}_{\mathbf{k}\mathbf{k}'} &= \langle \mathbf{k} \uparrow, -\mathbf{k} \downarrow | \mathcal{W}(1, 2) | \mathbf{k}' \uparrow, -\mathbf{k}' \downarrow \rangle_a \\ &\quad + (|\mathbf{e}_{\mathbf{k}} - \mu| + |\mathbf{e}_{\mathbf{k}'} - \mu|) \langle \mathbf{k} \uparrow, -\mathbf{k} \downarrow | \mathcal{N}(1, 2) | \mathbf{k}' \uparrow, -\mathbf{k}' \downarrow \rangle_a \\ &\equiv \frac{1}{N} [\tilde{\mathcal{W}}(\mathbf{k} - \mathbf{k}') + (|\mathbf{e}_{\mathbf{k}} - \mu| + |\mathbf{e}_{\mathbf{k}'} - \mu|) \tilde{\mathcal{N}}(\mathbf{k} - \mathbf{k}')]. \end{aligned}$$

- The gap is (mostly) determined by the matrix element $\langle \mathbf{k} \uparrow, -\mathbf{k} \downarrow | \mathcal{W}(1, 2) | \mathbf{k}' \uparrow, -\mathbf{k}' \downarrow \rangle_a$

BCS Theory with strong correlations

Analysis of the pairing interaction:

After lengthy calculations: An (almost) ordinary gap equation

$$\Delta_{\mathbf{k}} = -\frac{1}{2} \sum_{\mathbf{k}'} \mathcal{P}_{\mathbf{k}\mathbf{k}'} \frac{\Delta_{\mathbf{k}'}}{\sqrt{(\mathbf{e}_{\mathbf{k}'} - \mu)^2 + \Delta_{\mathbf{k}'}}^2}.$$

At low densities, all operators become local

$$\begin{aligned} \mathcal{P}_{\mathbf{k}\mathbf{k}'} &= \langle \mathbf{k} \uparrow, -\mathbf{k} \downarrow | \mathcal{W}(1, 2) | \mathbf{k}' \uparrow, -\mathbf{k}' \downarrow \rangle_a \\ &\quad + (|\mathbf{e}_{\mathbf{k}} - \mu| + |\mathbf{e}_{\mathbf{k}'} - \mu|) \langle \mathbf{k} \uparrow, -\mathbf{k} \downarrow | \mathcal{N}(1, 2) | \mathbf{k}' \uparrow, -\mathbf{k}' \downarrow \rangle_a \\ &\equiv \frac{1}{N} [\tilde{\mathcal{W}}(\mathbf{k} - \mathbf{k}') + (|\mathbf{e}_{\mathbf{k}} - \mu| + |\mathbf{e}_{\mathbf{k}'} - \mu|) \tilde{\mathcal{N}}(\mathbf{k} - \mathbf{k}')] . \end{aligned}$$

- The gap is (mostly) determined by the matrix element $\langle \mathbf{k} \uparrow, -\mathbf{k} \downarrow | \mathcal{W}(1, 2) | \mathbf{k}' \uparrow, -\mathbf{k}' \downarrow \rangle_a$
- The “energy numerator” term regularizes the integral for zero-range interactions.

BCS Theory with strong correlations

Approximate solution of the gap equation

At low density, let

$$a_F = \frac{m}{4\pi\rho\hbar^2} \mathcal{W}_F$$

$$\Delta_F \approx \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_F k_F}\right).$$

Corrections: $a_F \rightarrow a_0$ for $\rho \rightarrow 0+$

If $a_F = a_0 \left[1 + \alpha \frac{a_0 k_F}{\pi}\right]$ then

$$\Delta_F \approx \frac{8}{e^2} e_F \exp\left(-\frac{\alpha}{2}\right) \exp\left(\frac{\pi}{2a_0 k_F}\right).$$

Questions:

- What influences the pre-factor (Gorkov-corrections *etc.*):

Solution of the gap equation

... and what approximations do

- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_0 k_F}\right)$

Solution of the gap equation

... and what approximations do

- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_0 k_F}\right)$
Can be far off
- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_F k_F}\right)$

Solution of the gap equation

... and what approximations do

- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_0 k_F}\right)$
Can be far off
- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_F k_F}\right)$
Not too bad
- Full solution

Solution of the gap equation

... and what approximations do

- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_0 k_F}\right)$

Can be far off

- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_F k_F}\right)$

Not too bad

- Full solution

- Exponential behavior becomes universal, prefactor not.

Solution of the gap equation

... and what approximations do

- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_0 k_F}\right)$

Can be far off

- $\Delta_F = \frac{8}{e^2} e_F \exp\left(\frac{\pi}{2a_F k_F}\right)$

Not too bad

- Full solution

- Exponential behavior becomes universal, prefactor not.
- Low density expansion valid only for physically uninteresting cases.

$$\frac{\Delta_{SP}(k_F)}{e_F} = \frac{8}{e^2} \exp\left(\frac{\pi}{2a_0 k_F}\right)$$

- Estimate by pairig matrix element too small

$$\frac{\Delta_{FW}(k_F)}{e_F} = 8 \frac{m}{m^*} \exp\left(\frac{4}{3} \frac{\hbar^2 k_F^2}{2m^* W_F}\right)$$

Summary

- Equivalence of Jastrow-Feenberg theory and local parquet
- FHNC-EL diverges for phase transitions:
in the particle-hole channel for spinodal decomposition,
in the particle-particle channel for dimer formation
- Long-ranged properties are determined by many-body effects,
not by vacuum
- Many-Body effects for *long-ranged* correlations $r > 1/k_F$ imply
Many-Body effects for long wavelengths $k < k_F$
- Non-universal behavior of the pairing matrix element.
- The Jastrow-Feenberg wave function is not suitable for superfluid
systems
- Superfluid parquet theory fixes the problems
- Operator-dependent correlations are still a wide open field
